

The Missing Peace Board Overhaul

The Board should become the Vision Studio of The Missing Peace. It should not feel like a static Pinterest clone or a plain file drop area. It should feel like a living creative workspace where couples, planners, and trusted collaborators can spend hours collecting, arranging, reacting to, discussing, approving, and transforming inspiration into an actual wedding plan.

The current board is moving in the right direction because it has sections, link input, upload, gallery, and canvas views. The next version needs to make the board feel tactile, visual, collaborative, and magical. When a user adds a Pinterest pin, vendor link, TikTok, Instagram reel, YouTube video, GIF, color palette, photo, PDF, or note, the board should not simply create a small card. It should create a beautiful object that can be moved, resized, layered, grouped, commented on, voted on, approved, and poofed into the planning engine.

The Board should have two identities. First, it is a creative studio where inspiration lives. Second, it is a conversion surface where inspiration becomes planning action. A venue photo can become a venue candidate. A catering reel can become a food direction. A floral image can become a decor requirement. A song link can become a playlist item. A dress photo can become an attire note. A travel video can become a honeymoon idea. Every beautiful fragment should have a path into the plan.

The user should be able to paste a URL and see the board pull in the strongest available preview. If the link has a clear image, the image should become the hero visual. If it is a video or reel, the card should show a playable embed or a thumbnail preview with a play state. If it is a vendor website, the card should show the business name, website, image, category guess, and a button to poof it into a vendor. If it is a Pinterest pin or board, the card should preserve source attribution and show the strongest visual available. If the platform blocks a rich preview, the app should gracefully offer a screenshot upload, manual image upload, or simple link card instead of leaving the user with a dead gray box.

The board should support many types of creative objects. Users should be able to add image pins, video embeds, reels, GIFs, vendor cards, color swatches, text notes, sticky notes, checklist cards, polls, decision cards, budget chips, timeline markers, playlist cards, location cards, document cards, and Dream Cloud references. These should not all look the same. A song should feel different from a venue. A vendor should feel different from a color palette. A Dream Cloud should feel different from a catering photo. The board becomes richer when the objects have personality.

The main interaction should be drag, resize, layer, group, and poof. A user should be able to drag items anywhere on the canvas, resize images, stack cards into mood piles, group related items into a collage, add captions, pin favorites, duplicate objects, lock objects, and move items between sections. The board should support freeform collage building, but it should also allow structured sections for people who want order. The user should not have to choose between beautiful chaos and practical organization. They should be able to move between both.

The board should have three viewing modes. Gallery mode is for fast browsing, like a beautiful grid of saved inspiration. Canvas mode is for freeform collage building, where users can arrange items visually. Presentation mode is for showing the approved vision cleanly to a partner, planner, family member, or

vendor. Presentation mode should feel polished, like a curated wedding concept deck generated from the board.

The Master Vision should be the approved version of the board. Every section can have rough ideas, favorites, maybes, and rejected items, but only approved pieces should flow into the Master Vision. If the user approves a venue inspiration card, it appears in the Venue section of Master Vision. If they approve a food photo, it appears in Food and Beverage. If they approve a color palette, it appears in Design Direction. If they approve a song, it appears in Playlist or Music and Entertainment. The Master Vision should not be another board the user has to manually maintain. It should be automatically assembled from approved items.

Approval should feel collaborative. Each item should be able to collect reactions, votes, comments, and final approval. The couple can decide whether both partners must approve an item, whether a planner can approve it, or whether one owner can approve on behalf of the group. This matters because the board is where taste, family opinions, planner input, and budget reality will collide. The product should make those decisions visible instead of letting them disappear into texts and screenshots.

The board should feel social without becoming noisy. It should borrow the best parts of Instagram and Discord: reactions, comments, threads, mentions, presence, live cursors, typing indicators, and activity updates. If one partner adds a venue pin, the other partner should be able to heart it, comment, vote, ask a question, or request a decision. If the planner is inside the workspace, they should be able to leave notes directly on items. This keeps the conversation attached to the inspiration instead of scattered across DMs.

Every card should have a detail drawer. When a user clicks a board item, the drawer should show the image, video, link, source, notes, comments, reactions, votes, approval state, tags, section, linked planning objects, and poof actions. The drawer should also show where the item came from and what it has become. For example, a venue pin might show that it was added from Pinterest, approved by both partners, poofed into a vendor record, linked to a budget estimate, and added to the Master Vision.

The Poof interaction should be central. It should not be hidden in a menu. It should feel like the board's magic trick. A user should be able to select an item and poof it into a vendor, decision, Money Map item, timeline task, document, playlist song, guest experience note, honeymoon idea, Peace Note, or Master Vision piece. The app should show a soft animation as the item becomes part of the planning engine. The user should feel the moment when inspiration turns into action.

The board should include widgets. These are small interactive tools the user can drop into the canvas. A poll widget can ask, "Which venue mood feels most like us?" A budget widget can show the estimated cost of a design direction. A countdown widget can show days until the wedding. A color palette widget can hold the wedding colors. A map widget can show possible venues or honeymoon spots. A playlist widget can collect songs. A checklist widget can track next steps. A quote comparison widget can compare vendors. A guest experience widget can capture ideas for welcome bags, signage, seating, and hospitality.

The board should support collage tools. Users should be able to crop images, round corners, add frames, add torn paper style edges, rotate cards slightly, overlap items, create mood clusters, add labels, use stickers, add arrows, draw circles, add handwritten notes, and create section covers. This should be tasteful and restrained. The style should feel editorial, romantic, and warm, not childish or chaotic. The product should give users creative freedom while keeping the aesthetic aligned with The Missing Peace.

The board should include a magic arrange feature. If a user has a messy pile of inspiration, the Peacekeeper can organize it into sections, clusters, or a polished mood board. The user could ask, “Organize these into a romantic garden reception,” or “Separate these by venue, food, florals, and attire,” or “Make this feel more elegant and less rustic.” The AI should not overwrite the board without permission. It should suggest arrangements and let the user accept them.

The board should include smart tagging. When a user adds an item, the system should infer what it is. A floral image should receive tags like florals, ceremony, blush, garden, romantic, spring, or centerpiece. A catering reel may receive tags like food and beverage, family style, grazing table, dessert, halal, vegetarian, or late night snack depending on the content and notes. A venue link may receive venue, outdoor, estate, ballroom, restaurant, destination, or hotel. Tags should be editable.

The board should include mood extraction. When several images are approved, the Peacekeeper should be able to summarize the visual direction. It might say, “Your approved venue and decor pieces are leaning warm, intimate, garden inspired, softly lit, and family centered.” That summary can then update the Wedding Compass, Master Vision, Money Map, and vendor requirements. This is one of the ways the board becomes part of the engine instead of a static gallery.

The board should protect source attribution. Every imported item should store the original URL, source platform, title, creator if available, and date added. The app should not pretend third party images belong to the user. If the image cannot legally or technically be stored permanently, the product should store a preview, source link, and user uploaded fallback when needed. This keeps the product safer and more respectful.

The board should be collaborative in real time. Users should see who is present, where they are looking, what they are editing, and what they are reacting to. Live cursors, active user avatars, item level comments, and activity trails should be built into the experience. If two users are editing the same item, the app should avoid conflicts by locking the active text field or showing who is editing.

The board should feel alive through motion. Cards should gently lift on hover. New items should softly appear. Approved items should glow and settle into place. Poofed items should drift toward the module they are becoming. A collage group should slightly breathe when selected. Dragging should feel smooth. Dropping should feel satisfying. The product should include reduced motion settings so the experience remains accessible.

The board should also work well on mobile. Mobile users may not need the full canvas power at launch, but they must be able to add links, upload images, react, comment, vote, approve, open item drawers, and poof items. On mobile, the board can shift into a stack based or section based view with a simplified canvas mode. The mobile experience should still feel interactive, not like a stripped down viewer.

The technical build should treat board items as flexible objects. Each item should have a type, source, preview data, media assets, position, size, layer, rotation, section, tags, approval state, comments, reactions, votes, linked objects, and activity history. Board items should support images, videos, embeds, links, files, text, widgets, and planning objects. The canvas should store layout separately from the item content so the same item can appear in Gallery, Canvas, Master Vision, and Presentation modes.

The media pipeline should use multiple preview strategies. First, try provider specific embed or oEmbed where available. Second, try Open Graph metadata. Third, try standard metadata and page images. Fourth, allow manual image selection or upload. Fifth, fall back to a clean link card. The user should never be punished because a website blocks previews. They should always have a path to make the card beautiful.

The first implementation should focus on making URL pins visual. Paste a Pinterest, vendor, TikTok, YouTube, Instagram, wedding blog, Google Maps, hotel, restaurant, or product link. The app should create a rich card with the best available image, title, source, and action options. If the link is a video, show a playable embed where allowed or a thumbnail with a source link. If the link is a vendor, offer to poof it into Vendors. If the link is a song or video, offer to poof it into Playlist. If the link is a venue, offer to poof it into Venue and Money Map.

The database should include boards, board sections, board items, board item assets, board layouts, board comments, board reactions, board votes, board approvals, board tags, board widgets, board item links, board activity events, master vision items, and poof actions. Each board item should be able to connect to a vendor, Money Map item, decision, timeline task, document, playlist song, honeymoon item, Peace Note, Dream Cloud, or Wedding Compass value.

The acceptance standard for the next board iteration is simple. A user should be able to paste a link and get a beautiful visual card. They should be able to drag it, resize it, comment on it, react to it, vote on it, approve it, and poof it into the plan. Approved pieces should automatically appear in Master Vision under the right section. The board should support images, videos, GIFs, embedded media, widgets, and uploads. It should feel satisfying enough that a couple would want to spend an evening building their wedding world together.

The Board should become the place where the Dream becomes visible.
