

The Missing Peace Product Update

Updated Positioning

The Missing Peace is a Wedding Planning Engine.

It is a collaborative planning system that helps couples turn dreams, inspiration, budget, guest expectations, vendors, dates, documents, and decisions into one peaceful wedding plan.

The board is still central, but it is no longer the full identity of the product.

The board is the creative surface.

The engine is the intelligence layer.

The product promise is:

“Turn the dream into the plan, and keep the plan aligned with what matters.”

Why This Update Matters

Calling The Missing Peace a board makes the product feel like Pinterest, Miro, Milanote, or Notion with wedding features.

Calling it a Wedding Planning Engine makes it feel like a new category.

A board collects ideas.

A planner checklist tracks tasks.

A marketplace helps find vendors.

A Wedding Planning Engine connects everything:

Dream.

Budget.

Destination.

Guest count.

Vendors.

Inspiration.

Documents.

Timeline.

Decisions.

Honeymoon.

Emotional meaning.

Family pressure.

Planning stage.

The product should not just ask, "What do you like?"

It should ask:

"What does this mean?"

"What does this decision affect?"

"What needs to happen next?"

"Does this still match the Dream?"

New Category Definition

A Wedding Planning Engine is a private collaborative workspace that translates wedding inspiration and planning inputs into structured decisions, timelines, budgets, vendor requirements, guest rules, and next best actions.

The Missing Peace should be the system that helps couples and planners move from:

Dreaming

to deciding

to booking

to tracking

to celebrating

without losing the peace that started the wedding in the first place.

Updated One Line Description

The Missing Peace is a Wedding Planning Engine that turns your wedding Dream into a living plan for every decision, vendor, guest, date, dollar, and detail.

Updated Product Loop

The core product loop is now:

Define the Dream.

Collect inspiration.

Poof ideas into the plan.

Make decisions.

Track budget, vendors, guests, and dates.

Check everything against the Dream.

Update the plan as things change.

Protect the peace.

Product Architecture

The Missing Peace should be structured as an engine with several connected layers.

1. Dream Layer

Captures meaning, emotional priorities, cultural values, traditions, non negotiables, and things to avoid.

Main output:

Wedding Compass.

2. Inspiration Layer

The visual and creative board where users collect links, pins, uploads, screenshots, vendor ideas, attire, food, color schemes, venues, honeymoon ideas, and design inspiration.

Main output:

Organized board items that can be converted into planning actions.

3. Decision Layer

Tracks all open, pending, approved, deferred, rejected, and changed decisions.

Main output:

Decision clarity and approval history.

4. Planning Layer

Generates timeline, tasks, milestones, next actions, and planning priorities.

Main output:

A living wedding roadmap.

5. Budget Layer

Tracks advisory budget, estimates, quoted costs, committed costs, future payment placeholders, category pressure, and budget risk.

Main output:

Financial awareness without payment processing in version one.

6. Vendor Layer

Tracks vendor categories, shortlisted vendors, inquiries, quotes, contracts, documents, tasks, and booking status.

Main output:

Vendor progress and missing vendor gaps.

7. Guest Layer

Tracks households, guest count, invitation rules, RSVP status, meals, dietary needs, accessibility needs, and travel notes.

Main output:

Guest clarity and hospitality planning.

8. Document Layer

Stores contracts, quotes, invoices, mood sheets, PDFs, menus, legal documents, floor plans, and notes.

Main output:

Organized planning records.

9. Collaboration Layer

Allows partners, planners, and approved collaborators to work together in real time with comments, votes, approvals, mentions, permissions, and activity tracking.

Main output:

Shared planning without scattered conversations.

10. Peace Layer

Checks whether plans still match the Wedding Compass and warns the couple when the wedding is drifting away from the original Dream.

Main output:

Emotional alignment.

New Core Feature

Feature name:

The Peace Engine

Feature Summary

The Peace Engine is the intelligence layer inside The Missing Peace.

It reads the couple's Dream, planning stage, budget, destination, guest count, board items, vendors, documents, decisions, and timeline. Then it produces practical planning guidance.

The Peace Engine does not replace a planner. It makes planning clearer.

It helps the couple and planner understand:

What matters most.

What is missing.

What is overdue.

What decisions are blocked.

What budget categories are at risk.

What vendor categories still need attention.

What board ideas should become real planning actions.

What choices no longer match the Wedding Compass.

What the next best actions should be.

Feature Goal

The Peace Engine should turn The Missing Peace from a passive workspace into an active planning system.

It should constantly answer:

“What should we do next, and why?”

User Experience

First Use

After the couple completes Dream, the Peace Engine generates the first wedding plan.

It creates:

Planning roadmap.

Budget priorities.

Vendor priorities.

Board sections.

Decision queue.

First tasks.

Guest planning prompts.

Document folders.

Honeymoon setup, if enabled.

Peace Score.

Compass Checks.

Ongoing Use

Every time the user changes something important, the Peace Engine reviews the plan.

Important changes include:

Wedding date changed.

Guest count changed.

Budget changed.

Venue added.

Vendor booked.

Vendor declined.

Document uploaded.

Board item approved.

Board item poofed.

Decision approved.

Decision changed.

Honeymoon module added.

Planner invited.

Payment milestone added.

The Peace Engine should then update the plan and suggest next actions.

Main Peace Engine Outputs

1. Next Best Actions

The engine should recommend three to five actions at a time.

Examples:

Finalize guest count range before comparing venues.

Choose top three catering styles from your Food and Hospitality Dream cards.

Request quotes from two photographers this week.

Review budget impact before increasing guest count.

Approve or reject the garden venue board before adding more venue ideas.

2. Planning Roadmap

The roadmap is a living plan based on wedding date, stage, destination, and complexity.

It should include:

Major planning phases.

Milestones.

Deadlines.

Tasks.

Dependencies.

Owner.

Status.

Linked board items.

Linked vendors.

Linked documents.

Linked decisions.

3. Decision Queue

The engine should identify unresolved decisions.

Examples:

Guest count range.

Venue type.

Wedding city.

Food service style.

Photography style.

Planner involvement.

Budget priority.

Child policy.

Plus one policy.

Cultural or religious ceremony needs.

Honeymoon inclusion.

4. Risk Radar

The engine should flag planning risks.

Risk examples:

Budget risk.

Guest count risk.

Timeline risk.

Vendor booking risk.

Document risk.

Decision bottleneck.

Dream mismatch.

Planner workload risk.

Family pressure risk.

Weather contingency risk.

Destination travel risk.

5. Compass Check

The engine should compare major choices against the Wedding Compass.

Example:

"This venue is beautiful, but it may not match your Dream of an intimate family centered dinner. It supports 300 guests and may push the event toward a larger production."

6. Budget Guidance

The engine should give advisory insights.

Examples:

"Your Dream prioritized food and hospitality, but your current budget gives more weight to decor than catering."

"Your guest count is the biggest cost driver right now."

"Before booking florals, decide whether photography or guest experience is the higher priority."

7. Vendor Gap Detection

The engine should identify missing vendors based on wedding type.

Examples:

"You have venue and catering started, but photography, officiant, florals, and entertainment are still missing."

"Because this is an outdoor wedding, you may need rentals, lighting, weather backup, and restroom planning."

8. Guest Impact Layer

The engine should explain how guest decisions affect cost, venue, food, seating, and timeline.

Examples:

"Adding 25 guests may affect catering, bar, seating, invitations, transportation, and hotel block needs."

"Your Dream favors intimacy. Consider setting a clear household rule before the guest list grows."

9. Poof Recommendations

The engine should suggest when inspiration should become action.

Examples:

"This catering image looks like a family style service idea. Poof it into a catering requirement?"

"This venue link looks serious. Poof it into a vendor record?"

"This tradition note should become a ceremony timeline item."

"This memory could become a Peace Note."

Peace Engine Inputs

The engine should read from:

Dream responses.

Wedding Compass.

Board items.

Approved board items.

Rejected board items.

Budget.

Budget categories.

Guest count.

Guest households.

Vendor records.

Vendor statuses.

Timeline tasks.

Planning stage.

Wedding date.

Destination.

Documents.

Decisions.

Honeymoon module.

User role.

Planner notes.

Activity history.

Peace Engine Data Objects

planning_engine_runs

Stores each time the engine reviews the workspace.

Fields:

id.

workspace_id.

trigger_type.

trigger_source_type.

trigger_source_id.

status.

started_at.

completed_at.

created_by.

summary.

planning_recommendations

Stores suggested actions.

Fields:

id.

dismissed.

planning_dependencies

Stores dependencies between planning objects.

Fields:

id.

workspace_id.

source_entity_type.

source_entity_id.

depends_on_entity_type.

depends_on_entity_id.

dependency_reason.

status.

created_at.

updated_at.

Example:

Catering quote depends on guest count range.

Venue booking depends on destination choice.

Timeline depends on ceremony start time.

planning_snapshots

Stores state of the plan at key moments.

Fields:

id.

workspace_id.

snapshot_type.

summary.

budget_snapshot_json.

vendor_snapshot_json.

guest_snapshot_json.

decision_snapshot_json.

timeline_snapshot_json.

dream_alignment_json.

created_at.

recommendation_feedback

Stores user feedback on recommendations.

Fields:

id.

workspace_id.

recommendation_id.

user_id.

feedback_type.

feedback_note.

created_at.

Feedback types:

helpful.

not_helpful.

wrong.

already_done.

not_relevant.

save_for_later.

Peace Engine Logic

The Peace Engine should combine deterministic rules with AI interpretation.

Deterministic Rules

Use rules for things that must be reliable.

Examples:

Budget math.

Guest count calculations.

Date based timeline generation.

Overdue tasks.

Missing vendor categories.

Permission logic.

Approval status.

Booking status.

Payment due dates.

Document linkage.

AI Interpretation

Use AI for things that require meaning and judgment.

Examples:

Summarizing Dream.

Explaining tradeoffs.

Detecting Dream mismatch.

Generating recommendations.

Creating planning language.

Interpreting board item meaning.

Summarizing vendor comparisons.

Suggesting discussion questions.

Turning inspiration into planning actions.

Claude Responsibilities

Claude should own the intelligence, language, prompts, and planning logic for the Peace Engine.

Claude should produce:

Prompt templates.

Recommendation language.

Planning rules.

Wedding roadmap templates.

Risk categories.

Decision categories.

Dream to plan translation logic.

Compass Check wording.

Budget insight wording.

Vendor gap logic.

Guest impact logic.

Planner facing summaries.

Couple facing summaries.

Claude should avoid:

Overly generic wedding advice.

Pushy recommendations.

Making final decisions for the couple.

Pretending to be a legal or financial advisor.

Overcomplicating the first version.

Claude Prompt Template

System instruction:

"You are the planning intelligence layer for The Missing Peace, a Wedding Planning Engine. Your job is to help couples and planners turn wedding dreams, inspiration, budget, guest details, vendors, documents, and decisions into a clear plan. Be calm, practical, emotionally intelligent, and specific. Do not make decisions for the couple. Explain tradeoffs clearly. Keep the Wedding Compass at the center of your reasoning."

Input:

Wedding Compass.

Planning stage.

Wedding date or date range.

Budget.

Guest count.

Destination.

Board items.

Approved ideas.

Rejected ideas.

Vendor records.

Open decisions.

Timeline tasks.

Documents.

Planner notes.

Honeymoon enabled or disabled.

Output:

Planning summary.

Top three to five next actions.

Open decisions.

Planning risks.

Dream alignment notes.

Budget guidance.

Vendor gaps.

Guest impact notes.

Poof suggestions.

Suggested discussion prompts.

Sample Peace Engine Output

Planning Summary:

“You are still in the early planning stage. Your Dream is clear around intimacy, food, family, and warmth, but the plan needs firmer boundaries around guest count and venue type before vendor outreach becomes useful.”

Next Best Actions:

1. Set a guest count range before comparing venues.
2. Choose whether the wedding should feel more like a formal reception or a family dinner.

3. Shortlist three venue types that match the Dream.
4. Create a catering priority list from your Food and Hospitality cards.
5. Decide whether the honeymoon module should be activated now or later.

Planning Risks:

"Guest count is the largest unresolved driver of budget and venue fit."

"Your board has strong visual direction, but few items have been converted into decisions."

Dream Alignment:

"Your current inspiration matches warmth and elegance, but some ballroom ideas may conflict with your desire to avoid overproduction."

Poof Suggestions:

"Poof the family style dinner image into a catering requirement."

"Poof the courtyard venue link into a vendor record."

"Poof the private prayer note into a ceremony timeline item."

Updated Home Dashboard

The Home dashboard should now be called:

Peace Center

The Peace Center should show:

Peace Score.

Wedding Compass summary.

Next Best Actions.

Planning Roadmap.

Decision Queue.

Risk Radar.

Budget Snapshot.

Vendor Gaps.

Guest Count Impact.

Upcoming Dates.

Recent Activity.

Updated Board Role

The Board should now be described as:

The visual planning surface inside the Wedding Planning Engine.

It is where users collect, arrange, discuss, and convert inspiration.

The Board remains one of the most important parts of the user experience, but it is not the product category.

Updated Dream Role

Dream is the first step of the engine.

Dream creates the Wedding Compass.

The Wedding Compass powers the Peace Engine.

This means the product flow becomes:

Dream creates meaning.

The Board captures inspiration.

The Peace Engine turns meaning and inspiration into a plan.

The Compass Check protects alignment.

The Peace Center shows what matters next.

Version One Scope For Peace Engine

Version one should include:

Wedding Compass generation.

Planning roadmap generation.

Next Best Actions.

Decision Queue.

Risk Radar.

Budget guidance.

Vendor gap detection.

Guest count impact notes.

Poof suggestions.

Compass Checks.

Manual feedback on recommendations.

Do not include in version one:

Automated vendor outreach.

Payment processing.

Public guest website.

Full legal contract review.

Native mobile app.

Advanced travel booking.

Vendor marketplace.

Acceptance Criteria

The user can complete Dream and generate a Wedding Compass.

The Peace Engine can generate a starting plan from onboarding and Dream data.

The Peace Center displays Next Best Actions.

The engine can detect missing vendor categories.

The engine can identify unresolved decisions.

The engine can flag basic budget risk.

The engine can explain guest count impact.

The engine can suggest Poof actions from board items.

The engine can compare a major planning choice against the Wedding Compass.

The user can accept, dismiss, defer, or complete recommendations.

The system stores engine runs and recommendation history.

The product positioning clearly says The Missing Peace is a Wedding Planning Engine.

The board is presented as a visual planning surface, not the full product identity.

Strong Product Opinion

This is the right move.

The Missing Peace should not compete as another wedding board.

It should compete as the system that makes the wedding make sense.

The board gives users beauty.

Dream gives users meaning.

The Peace Engine gives users movement.

That combination is the product.
